

CLAIMS

- 1 1. A protected lamp assembly comprising:
- 2 a. a tubular lamp element having energizing electrodes adapted to be coupled to a
- 3 source of electrical energy;
- 4 b. a protective housing element surrounding said lamp element and substantially
- 5 coextensive therewith;
- 6 c. resilient lamp support members for holding said lamp element within said
- 7 protective housing element spaced apart from the interior surfaces thereof; and
- 8 d. conductive means for coupling said electrodes to a source of energy exterior to
- 9 said protective housing element.

- 1 2. The protected lamp assembly of Claim 1, above, further including end cap
- 2 means mounted at the ends of said protective housing element.

- 1 3. The protected lamp assembly of Claim 2, above, wherein said lamp support
- 2 members are attached to and are integral with said end cap means.

- 1 4. The protected lamp assembly of Claim 1, above, wherein said conductive means
- 2 include a conductive coating in electrical contact with said electrodes.

1 5. A protected lamp assembly as in Claim 2, wherein said conductive means
2 include a conductor extending from one of the energizing electrodes to and through the
3 end cap at the opposite end of said lamp element.

1 6. A protected lamp assembly comprising:
2 a. at least one tubular lamp element having energizing electrodes adapted to be
3 coupled to a source of electrical energy;
4 b. a protective housing element surrounding said lamp element and substantially
5 coextensive therewith;
6 c. resilient lamp support members for holding said lamp element within said
7 protective housing element spaced apart from the interior surfaces thereof; and
8 d. conductive means for coupling said electrodes to a source of energy exterior to
9 said protective housing element.

1 7. The protected lamp assembly of Claim 6, above, further including;

2 a. a second tubular lamp element having energizing electrodes adapted to be
3 coupled to a source of electrical energy, said protective housing element surrounding said
4 second lamp element and substantially coextensive therewith;

5 c. resilient lamp support members for holding said second lamp element within
6 said protective housing element spaced apart from the interior surfaces thereof; and

7 d. conductive means for coupling said second lamp electrodes to a source of
8 energy exterior to said protective housing element.

1 8. A protected lamp assembly comprising:

2 a. a tubular lamp element having energizing electrodes adapted to be coupled to a
3 source of electrical energy;

4 b. a protective housing element surrounding said lamp element and substantially
5 coextensive therewith;

6 c. resilient lamp support members for holding said lamp element within said
7 protective housing element spaced apart from the interior surfaces thereof;

8 d. end cap means mounted at the ends of said protective housing element; and

9 e. conductive means for coupling said electrodes to a source of energy exterior to
10 said protective housing element.

1 9. The protected lamp assembly of Claim 8, above, wherein said lamp support
2 members are attached to and are integral with said end cap means.

1 10. The protected lamp assembly of Claim 9, above, wherein said conductive
2 means include elements extending out of said end cap means which are adapted to connect
3 to a source of energy.

1 11. The protected lamp assembly of Claim 9, above, wherein said conductive
2 means further include a conductor connected to one of the energizing electrodes at one
3 end of said tubular lamp element, said conductor extending to the opposite end of said
4 tubular lamp element and through said end cap means whereby a source of energy need
5 only be applied to one end of the protected lamp assembly.

1 12. The protected lamp assembly of Claim 8, above, wherein said conductive
2 means include a conductive coating in electrical contact with said electrodes.
